

SYSTEM OVERVIEW

Connected particulate visibility for dust-sensitive projects

VerifAir is a launch-stage platform developed by Erne Tech. It connects approved monitoring equipment, configured site connectivity, shared visibility, event workflows and operational reporting.

Launch-stage product: VerifAir is currently engaging with prospective pilot projects. This overview describes intended workflow and demonstration capability; it is not a customer case study.

From measurement to review

- 01 Measure**
Dustlight provides PM1, PM2.5 and PM10 readings in the approved application.
- 02 Connect**
The project design defines how available readings reach the VerifAir environment.
- 03 Review**
Authorised users view selected locations, readings, trends and system state.
- 04 Notify**
Configured project events can be presented to nominated recipients.
- 05 Respond**
The responsible team records operational actions and follow-up.
- 06 Close**
The event is reviewed and retained in the project reporting record.

Structured pilot deployment

- 01 Project discussion**
Clarify the work, operating environment and questions the team needs to answer.
- 02 Context review**
Review sensitive areas, likely monitoring locations and available connectivity.
- 03 Monitoring approach**
Define proposed locations, event ownership and reporting requirements.
- 04 Pilot deployment**
Assess the agreed workflow in the intended operating context.
- 05 Review and refinement**
Review information, feedback and technical limitations before refinement.

Important information: VerifAir provides project-level environmental particulate monitoring, alerting and operational reporting support. Readings indicate measured particle-size fractions and changing conditions; they do not identify material composition or independently establish personal exposure. VerifAir does not replace personal exposure assessment, occupational-hygiene advice, specialist sampling, risk assessment, controls or duties under applicable laws.
